

Critical thinking

Will the drivercity website deliver all the required function for the customers?

Introduction:

Drivercity is a carshare website that provides different brands and model of cars for customer to borrow for a period of time. This website has many useful functions that all customers are seeking to have. The functions that make this website catchy for users are the layouts, map and its performance. This website wouldn't be best for users if it didnt met the needs and commitments such as: user friendly, ease of use, locations, distances and directions. We can say this website is not the only website that has all options for user but we can say this one is the best choice for users.

Discussion:

This website meets all the expectations of users for the carshare website. The functions that users can take benefits from this websites are: it lists all the cars beside the map with cars details so the customer can go through if they have no idea of selection a good car. Also for the users who are not good at using map to check which car is closer to them, they can use the car list to check and get the information that they are looking for. This website provides 24/7 help/contact methods such as chat, call or email, depends on which option is the right one to get contacted to get help. These functions are pretty much all the needs that users expecting from a website., example: when a website is designed for the users who are good at using internet or familiar to usage of websites, what about the users who are not good at something or the users who are colorblind, they won't able to use the website.

The most important thing for a website should have is a better layout design to make it more catchy for users and the performance and functions of the website that makes it easy to use for users. Example if the website is boring, the users may head to other website to find something interesting, these can affect the business of the Drivercity as well. Sometimes the layout doesn't matter for some user, what they actually strict about is the performance and functions of the websites and if they can find what they actually after such as: map performance, whether their personal information can be safe or would they be able to see their records of booking.

This car share website gives unique performance for the users and that can be missing from the other websites. The drivercity websites gives the user's distance of the available car on the map and also listed beside map which make it easy for everyone. Example if the user is not familiar enough to see the nearest car available they can proceed to the car list beside the map and can get help for their. Users can easily book the car for a period of time with an easy and several options of payment. These website provides easy way of returning cars Example: if the car is borrowed and the user don't have to retune the car to the place they borrowed, they can look for available Drivercity parking spot near them to retune the car.

Conclusion:

We can conclude this argument with a positive evident and we can say this website is best for not only targeted users but everyone. It meets all the requirements and functions that a user can imagines. As we mentioned above, this could not be the only best website but it is one of the best.
